*corresponding author

Abstract—This non-submission document verifies that the official DSA 2026 LaTeX class can be compiled in a clean local build. It contains no scientific result and must be replaced by author-approved manuscript content.

Keywords—*template verification; reproducible build; PDF audit; DSA 2026*

1. INTRODUCTION

This skeleton checks the required title, author, affiliation, abstract, keyword, numbered-section, citation, and reference structures. The official submission instructions limit a Regular Paper to twelve pages and a Short Paper to ten pages, including content and references.

2. TEMPLATE CHECKS

The build uses the unmodified official `IEEEconf.cls` retrieved from the DSA 2026 template archive. Page size, margins, columns, and pagination are left to the class. The final manuscript will replace all pending author metadata and will be independently checked against the current instructions before submission. IEEE publication policy is consulted separately [1].

3. CONCLUSION

Successful compilation of this skeleton proves only template compatibility. It does not authorize a manuscript claim, experiment, model call, or submission.
