

# Merge-gate decision to metric computation flow

Each candidate is reviewed at one evidence level. Hidden labels are joined only after the review to compute aggregate metrics.

## Metric counts per evidence level $e$

$TP_e = \#(\text{accept} \wedge y = 1)$     $FP_e = \#(\text{accept} \wedge y = 0)$     $FR_e = \#(\text{reject} \wedge y = 1)$     $Esc_e = \#(\text{escalate})$

$FAR_e = FP_e / N_{\text{wrong}}$

$Precision_e = TP_e / (TP_e + FP_e)$

$Recall_e = TP_e / N_{\text{correct}}$

$EscRate_e = Esc_e / N$

$U_e = TP_e - 5FP_e - 0.25Esc_e - FR_e$     $Gain_e = U_e - U_{E0}$
